

KARVED / 16-WEEK TRANSFORMATION

THE BODY RECOMP BLUEPRINT

The exact system to drop under 10% body fat while building muscle,
not just losing weight.

What this guide is

This is the exact 2,400 calorie, 250g protein structure I used to drop under 10% body fat and build muscle at the same time.

Most guys think it is one or the other. Bulk and build, or cut and lose fat. The truth is you can do both at once, and most never learn how. It usually comes down to the basics being wrong: protein too low, meals inconsistent, progress stalled. That was me once too.

After a few accreditations and bodybuilding shows, I built a high-protein, whole-food approach that does not feel like punishment. Just structure, satiety and serious results. This is the same nutrition structure I give my coaching clients.

THE PRINCIPLE

Body composition is a reflection of your training. Body weight is a reflection of your diet. Get both right and the six pack takes care of itself.

<10%

TARGET BODY FAT

2,400

DAILY CALORIES

250g

DAILY PROTEIN

Where to start: energy balance

Fat loss has one non-negotiable: a calorie deficit. Without it, fat loss does not happen. No exceptions.

A deficit means you take in less energy than you burn. Modern life makes eating easy and burning hard, so the gap has to be built on purpose. It helps to know where your energy actually goes.

WHERE YOUR CALORIES OUT GO

Most of what you burn is automatic. The fastest lever you control is NEAT: your daily steps and movement.

■ THREE WAYS TO CREATE THE DEFICIT

1 DECREASE INTAKE

Eat fewer calories through food and drink.

2 INCREASE OUTPUT

Move more, mostly through daily steps and activity.

3 COMBINE BOTH

A small cut in food plus more movement. The most sustainable, and what we recommend.

KEY TAKEAWAY

Lead with output. More movement means more food on the plate, more nutrients, and a diet you can actually hold.

Track your intake and macros

You cannot manage what you do not measure. There are two reliable ways to track, and both work.

■ 1. TRACKING APP

Flexible and good if you like variety. Use MyFitnessPal, or Cronometer for more detail. Log everything, weigh your portions, and let the app show how you track against your target.

■ 2. MEAL PLAN

Structure and consistency, easier to stick to. Set your calories and macros, build meals that hit them, and repeat similar meals for simplicity.

■ THE THREE MACROS

PROTEIN

Builds and repairs muscle, and keeps you full between meals.

SOURCES

Chicken, fish, eggs, tofu, legumes.

CARBS

Your main energy source for training and daily life.

SOURCES

Rice, oats, fruit, vegetables.

FATS

Essential for hormones and absorbing vitamins.

SOURCES

Avocado, nuts, olive oil, oily fish.

KEY TAKEAWAY

Balance the three and you lose fat while protecting muscle and energy. Protein is the one most people get wrong, so anchor every meal around it.

The body-composition training formula

Chasing a number on the scale will not build the body you want. Your training shapes how you look. Your diet controls what you weigh.

More is not better. Do less, better. Train in this order of priority: intensity, then frequency, then volume.

WEEKLY VOLUME / WORKING SETS PER BODY PART, PER WEEK

■ TRAINING SPLITS WE USE

SPLIT	SESSIONS
3 days, upper	Push, Pull, Full Body
3 days, lower	Lower, Upper, Lower
4 days, upper	Push, Pull, Upper, Lower
4 days, lower	Push, Back & Hamstrings, Lower, Full Body

■ CARDIO

Strength training is the meal, cardio is the side. It lets you eat more as you lean out, not a fat-loss requirement. Early on, around weeks 4 to 6, you rarely need it.

The KARVED hybrid nutrition method

Track week to week, not meal to meal. Daily rigidity is miserable and rarely lasts. Some flexibility keeps the hormones that regulate hunger working with you, not against you.

■ OPTION 1 — FREE MEAL TOKENS

Take 2 to 3 free meals a week, like vouchers you spend when you choose. Aim for 85% compliance across the week, roughly 18 of 21 meals.

■ OPTION 2 — FLEXIBLE RANGE-BASED DIETING

Keep weekdays structured, then use a range on weekends. Set an upper and lower calorie threshold so you have room without losing progress.

OPTIMAL CALORIE TARGETS / KCAL PER KG OF BODYWEIGHT

Aggressive cut	22-25
Moderate cut	25-27.5
Maintenance	27.5-30
Lean bulk	30-32.5
Max bulk	32.5-38

Multiply by your bodyweight in kg. A 100kg aggressive cut is 2,200 to 2,500 kcal. Numbers shift after about two weeks as your metabolism adjusts.

WORKED EXAMPLE

100kg, 2,200 kcal target: 5 days at 2,200, 2 days up to 3,800. A weekly deficit near 3,200 kcal is about 0.5kg of fat lost. One kilo of fat is roughly 7,700 kcal.

Putting it together: 100kg to 90kg

Here is how a 16-week cut from 100kg to 90kg could look. It opens with two weeks of baseline testing, then adds output before any calories come down. You only cut food once your output is built and the scale tells you to.

THE 16-WEEK TREND · 100KG TO 90KG

■ HOW THE PLAN ADAPTS

PHASE	CALORIES	DAILY OUTPUT
Weeks 1-2 · 100 to 98kg	2,400 kcal	10k steps (baseline test)
Weeks 3-4 · 98 to 96kg	2,400 kcal	10k steps + 3 x 30min LISS
Weeks 5-16 · 96 to 90kg	2,100 kcal	12k steps + 3 to 4 sessions

ROUGH MATH · ENERGY PER UNIT OF OUTPUT

~50 kcal
per 1,000 steps

~150 kcal
per 30 min of LISS cardio

Estimates only, they will not correlate exactly. Adjust to the scale, not the spreadsheet.

HOW TO ADAPT

Drive your daily output up toward 1.5 to 2 hours of exercise before you cut calories any further. If your life will not allow that and you have closer to 60 minutes a day, drop calories first instead. Work to your real constraints.

NEED HELP ON YOUR JOURNEY?

KARVED COACHING PROGRAM

The same structure you have just read, built around you. Your calories, your training, your recovery, with the accountability to make it stick. Real coaching, measured results.

DM "PERFORM" TO APPLY

3 to 5 sessions a week. Whole foods. Real accountability.
